

Cap and Dividend

Cap and Dividend limits total carbon emissions and returns auction revenue to consumers. The dividend protects consumers from price increases and preserves political support for cutting emissions.

Which approach will better achieve the goals of AB32?

Cap

emissions,
auction allowances

and

return auction revenue
to consumers as a

Dividend

or

Grandfathering and “phasing in”
auctioning

Loopholes and exemptions

Offsets and “credits”

Omitting the transportation sector

Ignoring low-income communities

Protecting corporations but not the
middle class

Spending auction revenue on pet
projects or private-sector R&D

Safety valve and price ceiling
